Marking Scheme

Module 2 (Algebra and Calculus)

This document was prepared for markers' reference. It should not be regarded as a set of model answers. Candidates and teachers who were not involved in the marking process are advised to interpret its contents with care.

General Marking Instructions

- 1. It is very important that all markers should adhere as closely as possible to the marking scheme. In many cases, however, candidates will have obtained a correct answer by an alternative method not specified in the marking scheme. In general, a correct answer merits *all the marks* allocated to that part, unless a particular method has been specified in the question. Markers should be patient in marking alternative solutions not specified in the marking scheme.
- 2. In the marking scheme, marks are classified into the following three categories:

'M' marks

'A' marks

Marks without 'M' or 'A'

awarded for correct methods being used; awarded for the accuracy of the answers;

awarded for correctly completing a proof or arriving

at an answer given in a question.

In a question consisting of several parts each depending on the previous parts, 'M' marks should be awarded to steps or methods correctly deduced from previous answers, even if these answers are erroneous. However, 'A' marks for the corresponding answers should NOT be awarded (unless otherwise specified).

- 3. For the convenience of markers, the marking scheme was written as detailed as possible. However, it is still likely that candidates would not present their solution in the same explicit manner, e.g. some steps would either be omitted or stated implicitly. In such cases, markers should exercise their discretion in marking candidates' work. In general, marks for a certain step should be awarded if candidates' solution indicated that the relevant concept/technique had been used.
- 4. In marking candidates' work, the benefit of doubt should be given in the candidates' favour.
- 5. In the marking scheme, 'r.t.' stands for 'accepting answers which can be rounded off to' and 'f.t.' stands for 'follow through'. Steps which can be skipped are shaded whereas alternative answers are enclosed with rectangles. All fractional answers must be simplified.
- 6. Unless otherwise specified in the question, numerical answers not given in exact values should not be accepted.

	$=\frac{(-1)^m m(m+1)+(-1)^{m+1}(m+1)(2m+2)}{2}$		
	$=\frac{(-1)^m(m+1)(m-2m-2)}{2}$		
	$= \frac{(-1)^{m+1}(m+1)(m+2)}{2}$ So, the statement is true for $n = m+1$ if it is true for $n = m$.		
	By mathematical induction, the statement is true for all positive integers n .	1	
(b)	Putting $n = 333$ in (a), we have $\sum_{k=1}^{333} (-1)^k k^2 = \frac{(-1)^{333} (333)(334)}{2}.$	1M	
	So, we have $-1+4+\sum_{k=3}^{333} (-1)^k k^2 = \frac{(-1)^{333}(333)(334)}{2}$.		
	Thus, we have $\sum_{k=3}^{333} (-1)^{k+1} k^2 = 55614$.	1A

(a)	Note that $4(-1)^3 + 2(-1)^2 - 3(-1) - 1 = -4 + 2 + 3 - 1 = 0$.		
	Thus, $x+1$ is a factor of $4x^3 + 2x^2 - 3x - 1$.	1	
(b)	$\cos 3\theta$

	$=\cos\theta(\cos^2\theta - (1-\cos^2\theta)) - 2\cos\theta(1-\cos^2\theta)$		į.
	$=4\cos^3\theta-3\cos\theta$	1A	1
	3.77		
(c)	Note that $\theta = \frac{3\pi}{5}$ satisfies $\cos 3\theta = \cos(3\pi - 2\theta)$.	1M	
	Therefore, $\theta = \frac{3\pi}{5}$ satisfies $\cos 3\theta = -\cos 2\theta$.		
	By (b), $\theta = \frac{3\pi}{5}$ satisfies $4\cos^3\theta - 3\cos\theta = -(2\cos^2\theta - 1)$.	1M	for using (b)
	Hence, $\cos \frac{3\pi}{5}$ is a root of the equation $4x^3 + 2x^2 - 3x - 1 = 0$.		٠
	By (a), we have $4x^3 + 2x^2 - 3x - 1 = (x+1)(4x^2 - 2x - 1)$.		
	So, we have $4x^3 + 2x^2 - 3x - 1 = 4(x+1)\left(x - \frac{1+\sqrt{5}}{4}\right)\left(x - \frac{1-\sqrt{5}}{4}\right)$.		
	Since $\frac{\pi}{2} < \frac{3\pi}{5} < \pi$, we have $-1 < \cos \frac{3\pi}{5} < 0$.		
	Thus, we have $\cos \frac{3\pi}{5} = \frac{1-\sqrt{5}}{4}$.	1

	As (E) has a unique solution, we have $\begin{vmatrix} 1 & 1 & -1 \\ 4 & 6 & a \\ 5 & 1-a & 3a-1 \end{vmatrix} \neq 0$. So, we have $(a+2)(a+12) \neq 0$.	1M

(b) Putting $a = -2$ and $b = 14$, (E) becomes $\begin{cases} x + y - z = 3 \\ 2x + 3y - z = 7 \\ 5x + 3y - 7z = 13 \end{cases}$ By (b)(ii), the solution set is $\{(2t + 2, 1 - t, t) : t \in \mathbb{R}\}$. So, we have $x^2 + y^2 - 6z^2$ $= (2t + 2)^2 + (1 - t)^2 - 6t^2$ $= -t^2 + 6t + 5$	1M	
$= -(t^2 - 6t + 3^2) + 3^2 + 5$ $= -(t - 3)^2 + 14$ Therefore, the greatest value of $x^2 + y^2 - 6z^2$ is 14. Thus, there is no real solution of the system of linear equations	1M
